

SurfClean RC

ReCoat Activator for existing coating layers

High-end chemical technology

- ReCoat Activator for existing powder coating and liquid paint
- For recoating, overpainting and refinishing
- Cleans, softens and activates in one process step
- Practical for complex shapes and areas that are difficult to sand
- For trucks, trailers, equipment and industrial objects
- Also suitable for local paint repair and spot repair
- Application: 1:1 dilution with water or ready-to-use

Product properties

SurfClean RC prepares technically intact paint layers for a new coating layer. The product combines cleaning, light softening and surface activation, enabling the existing paint layer to be incorporated into a new coating build-up.

The technology is particularly relevant when mechanical sanding is difficult, time-consuming or almost impossible. Examples include complex geometries, profiles, weld seams, recessed areas and other hard-to-reach surfaces.

SurfClean RC

Efficient preparation before recoating, overpainting and refinishing

- ✓ Cleaning and activation in one step
- ✓ Practical for edges, corners and profiles
- ✓ Suitable for repair and overcoating

Not a paint stripper, but a ReCoat Activator

SurfClean RC is not a conventional paint stripper and is not intended to fully remove paint layers. The product supports controlled preparation of existing paint layers before overpainting, repainting or overcoating.

After the required contact time, the surface must be rinsed thoroughly with water. The correct contact time and process settings depend on the existing paint layer, the contamination and the new coating system.

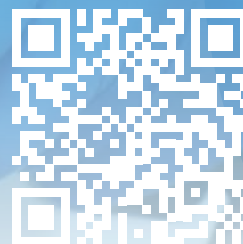

Tailored process advice

For reliable application, we recommend carrying out a practical test on the existing paint layer and the intended coating system. Contact us for process advice.

Customers say: "With complex shapes and hard-to-reach areas, SurfClean RC gives us more control in the recoating process."
